

Pitt' s Indie Game Dev Club' s 4th Meeting Summary Expansion

1. Opening Location and Room Change

The meeting began at 14:00 in 1211A.

This was not the originally intended classroom. The earlier room had already been occupied by others, so the group moved to 1211A instead. The notes also indicate that 1211A and 1211B were effectively part of the same larger classroom space, and that more than one club was present there during the meeting.

One of the other groups present was Robotic Automatic Society.

2. Early Work Period

From approximately 14:00 to 14:20, the group was mainly doing work.

The notes do not indicate any major full-group discussion during this period. Instead, this part of the meeting appears to have been a quieter work block before later conversations became more focused.

3. Robotics Building-Scan Discussion

At around 14:30, a discussion arose from something said by someone in Robotic Automatic Society.

The project described involved using:

- a robot dog,
- LiDAR,
- and an RGB camera

to scan the entirety of Benedum Hall.

At this point, I asked:

- why not use a **drone**?

The response was that this was not feasible. Two reasons were given:

- hardware-related concerns,
- and the fact that flying was not allowed inside the building.

The person speaking did not appear to have a complete solution at that moment.

I then suggested asking people with more relevant experience. Jayden replied that he had not previously thought of that. I added that, if one really intended to scan the entire building, it would need to be done discreetly. Jayden then added that such people might not have time to help. I replied that help does not necessarily have to be obtained through money alone, but could also come through food, material support, or service-based exchange. The final response recorded was:

- **sure**
-

4. Jet Joining the Group

The notes clarify that **Jet was not originally part of the group, but joined the group during this meeting.**

This is recorded as a straightforward group update rather than as part of one of the longer technical or thematic discussions.

5. Transition to Vibe Coding Discussion

At around **14:45**, after **Jet left**, the discussion shifted to **VC**, later clarified as **vibe coding**.

This appears to have been one of the main technical conversations of the meeting.

6. Presentation of the Voxel Project

During the VC discussion, I showed my **voxel world project**.

Jack also showed his own project. This made the discussion less abstract, since it was grounded in two actual project examples rather than in general opinions alone.

7. Jack' s Criticism of the Project and LLM Use

Jack stated that his own code was largely **hand-written**.

He also said that my project had **many problems**, which I agreed with. In addition, he remarked that **large language models do not reliably obey intent**.

The discussion then broadened from my own project into a more general conversation about **vibe coding**. The shared tone of the notes suggests frustration with the fact that, although such workflows can be fast, they often leave the user without a clear understanding of what is actually happening internally. The notes also record the feeling that this can make things more complicated rather than less.

8. Gautam' s Departure

At some point after the VC discussion, **Gautam left early**.

This departure matters mainly because the later religion discussion took place after that point and therefore did not involve exactly the same set of people as the earlier room discussion.

9. Religion Discussion Triggered by Bible Search

Near the end of the classroom portion of the meeting, I noticed that **Sam had a Bible search bookmark in Chrome.**

That became the entry point for a discussion about religion. I asked whether **Americans are very evangelical.** Sam replied that there are indeed many Christians in the United States, and that **he himself is one of them.**

I then said that I had previously tried reading the **Bible** out of curiosity, beginning from **Genesis**, but stopped after reading more than 100 pages because it was too dry. I added that having an **LLM** read it is much faster. Jayden responded that this was indeed very fast, and that it almost seemed as though everything could now be handed over to a large language model.

From there, the conversation gradually turned toward **Christian history.**

10. Transition from Sitting Discussion to Walking Discussion

When the group left the classroom, the meeting did **not** immediately end.

Instead, the format of the conversation changed. What had previously been a seated discussion turned into a **walking discussion.** At that point, there were still **four people** continuing together.

11. Split at Forbes and S. Bouquet

As the group continued walking and reached the area around **Forbes and S. Bouquet**, the four split into two pairs:

- Jayden and Jack
- Sam and me

This division matters because the final discussion recorded in the notes took place specifically between **Sam and me**, rather than as part of the larger four-person conversation.

12. Continued Discussion with Sam on a Bible-Based VC Game

After the split, Sam and I continued discussing the idea of a **VC-based Bible game**.

The idea was not simply to take one or two Biblical stories. Rather, the intention was to build a game by relying on the **content of the Bible as a whole**.

This was the reason behind my earlier question about whether Americans are very evangelical. I already had this possible game concept in mind.

In this later one-on-one exchange, I again explained that I had once tried reading the Bible directly, starting from **Genesis**, but stopped after more than 100 pages because the text felt too dry. By contrast, using an **LLM** to read through it seemed much faster. This line of discussion again moved toward **Christian history**.
